TITLE: A wideband pulse amplifier

PERIODICAL: Pribory i tekhnika eksperimenta, no. 3, 1962,  
34 - 86

TEXT: The amplifier consists of three stages of distributed amplification, each consisting of 4 tubes. The output and middle stages are based on secondary emission tubes, type 6Zh1P (6V1P). It is possible (by employing these tubes) to obtain a symmetrical output and high output voltages. However, since the tube 6V1P is nonlinear at small signals, the input stage is based on tubes, type 6Zh22P (6Zh22P), whose input capacitance is almost identical with that of 6V1P, so that identical lines could be employed in all grid circuits. The distributed loads of the amplifier stages are in the form of lumped delay lines based on m-derived filters, the wave impedance of the anode, dynode and grid lines being  $150\Omega$ . The bandwidth of the amplifier is about 150 Mc/s per stage, which

Card 1/2

S/120/62/000/003/019/048  
E192/E582

A wideband pulse amplifier

corresponds to a rise time of about  $3 \times 10^{-9}$  sec. The output of the amplifier is applied to the plates of an oscilloscope by means of a cable, type RK-50 (RK-50), about 1 m long. The amplification of the system at the anode output is about 240 and at the dynode it is about 160, the symmetrical output giving a gain of 400. The maximum amplifier output at the anode is 140 V and at the dynode- 80 V. The longest pulses applied should not exceed 3  $\mu$ s in order to avoid the fatigue effects in the secondary emission tubes. The authors express their gratitude to I.M. Cherednichenko for discussing the results and to A.V. Filatov and B.F. Krest'yaninov for preparing the experimental models of the device. There are 5 figures.

TITLE: Instrument for the Measurement of Microsecond Time Intervals  
(Pribor dlya izmereniya mikrosekundnykh intervalov vremeni)

PERIODICAL: Pribory i Tekhnika Eksperimenta, 1958, Nr 2, pp 31-36  
(USER)

ABSTRACT: Short time intervals can be measured either by using a standard frequency oscillator and a counter, or by employing a delay line fitted with a number of coincidence circuits. For the measurement of the time intervals of the order of a few  $\mu$ s the oscillator plus counter technique may not be sufficiently accurate. On the other hand, the delay line measurement, though giving a satisfactory absolute accuracy, cannot be used in the measurement of the time intervals of the order of 100  $\mu$ s. In the instrument described, the two techniques have been combined in such a manner as to take advantage of the merits of both. The instrument consists of a crystal oscillator operating at 1 Mc/s, and 2 identical measuring lines and a counter (see Fig.1). The interval between two electrical pulses, applied to two different inputs, can be measured as follows: the first pulse is applied to one of the lines and at a certain point of the line produces a coincidence with a pulse from the oscillator, which is

Card 1/3

DOV/120-56-1-7/37

Instrument for the Measurement of Microsecond Time Intervals.

applied at the opposite end of the line. The coincidence at a given section of the line results in a visual indication by means of a special thyratron plus a glow-discharge tube circuit. The second pulse is applied to the second line and causes a coincidence with  $(k + 1)$ th oscillator pulse at a section of the second line. The measured time interval is thus equal to an integral number of  $\mu s$  which is equal to  $k$  and a time interval  $\Delta$  which is equal to the difference between the coincidence indicators of the two lines. The electrical length of each measuring line is  $0.5 \mu s$  and each line is fitted with 10 coincidence indicators. A detailed circuit diagram of the instrument is given (see Fig.2) and its main units, such as the oscillator and its pulse-forming network, the measuring lines and the counting circuits are discussed in some detail. It is pointed out that the errors of measurement are due to: (1) The electrical length of the line between neighbouring indicators, (2) the inaccuracy and instability of the oscillator, (3) the instability of the resolving time of the indicators, (4) the instability of the standard measuring pulses, and (5) the instability of the lines. The instrument was tested under practical conditions

Card 2/3

JW/LJ-15-147/37

Instrument for the Measurement of Microsecond Time Intervals.

and it was found to have an error of  $0.05 \mu\text{s}$  plus an additional probable error not exceeding  $3 \times 10^{-8}\text{s}$ . The instrument is suitable for the measurement of the time intervals ranging from 5 to 256  $\mu\text{s}$ . There are 2 figures and 1 English reference.

TITLE: Existence and uniqueness of solution in the theory of linear rheology. I.  
First borderline problem

SOURCE: Aplikace matematiky, v. 9, no. 5, 1964, 321-327

TOPIC TAGS: solid mechanics, boundary problem, applied mathematics, flow,  
integral equation, integral transform

ABSTRACT: The existence and uniqueness of the solution of the first  
boundary problem (Dirichlet-Poisson) in the linear three-di-  
mensional rheology is proved. Assumed is the homogeneity and iso-  
tropy of materials, and a constant coefficient of lateral con-  
traction invariable with respect to time. Plastic flow and  
aging of the material is taken into account. Volterra's integral  
equation is applied to transform the problem into one concerning  
the theory of elasticity in which existence and uniqueness are  
valid.

TITLE: Existence and uniqueness of the solution in the theory of linear creep.  
II. Second boundary value problem

SOURCE: Aplikace matematiky, v. 10, no. 5, 1965, 391-398

TOPIC TAGS: uniqueness, existence, creep, boundary value problem, mathematic physics,  
stress analysis

ABSTRACT: The existence and uniqueness of the solution of the second boundary problem  
(of the Neumann type) is proved in the theory of three-dimensional linear creep.  
Homogeneity and isotropy of the materials and invariance with respect to time of  
the coefficient of lateral contraction are assumed. Not only hereditary phenomena  
but also the age of the materials are considered. Orig. art. has: 30 formulas.

TITLE: Investigation of the indicatrix of scattering of light by large absorbing particles of irregular form

SOURCE: Mezhvedomstvennoye soveshchaniye po aktinometrii i optike atmosfery. 5th, Moscow, 1963. Aktinometriya i optika atmosfery (Actinometry and atmospheric optics); trudy soveschaniya. Moscow, Izd-vo Nauka, 1964, 108-113

TOPIC TAGS: atmospheric optics, light scattering, atmospheric absorption, atmospheric physics, aerosol, particle shape, scattering indicatrix

ABSTRACT: This paper is a continuation of investigations begun by Ye. O. Fedorova (Trudy GOI, 1957, 25, No. 151). It presents an experimental study of the indicatrix of scattering of light by individual, large, slightly absorbing particles of irregular form. These data are compared with computed data for spherical particles with the same optical constants. The first part of the paper discusses the results of a theoretical investigation of the scattering of light by spherical, slightly absorbing particles; the second part presents the experimental data. The particles of investigated matter successively entered a light beam. Upon passing through the beam the particle scatters light in all directions.

Card 1/3

ACCESSION NR: AT5011164

The small quantities of light scattered by individual particles are summed on a photographic film. The density of blackening on the film is used to determine the angular distribution of scattered radiation, that is, the indicatrix of scattering. The apparatus is described fully in the paper by Fedorova mentioned above. Among the results, it is noted that with an increase in the wavelength of light the indicatrix of scattering is extended forward as a result of a decrease in the refractive index, whereas for absorbing particles this effect is considerably greater. This confirms the conclusion that with an increase in absorptivity the indicatrices of scattering of particles of irregular form are elongated forward. The degree of polarization for spherical particles is large and changes sharply with the angle of scattering. Regardless of the polarization of the incident light the indicatrices are very similar. The absolute value of the degree of polarization for particles of irregular form is insignificant. Comparison of the results of scattering on particles of spherical and irregular form demonstrates convincingly that the character of light scattering by particles of regular and irregular form is essentially different. For this reason, it is impossible to model particles of an arbitrary form by spherical centers of scattering of some effective size, as frequently is done. "In conclusion, the authors express deep appreciation to Ye. O. Fedorova for use of the apparatus used in the investigations, advice and discussion of the results." Orig. art. has: 8 formulas and 3 figures.
